

A PRACTICAL FABRIC BUILD

Your data stack is ready.

Now give it a way to answer questions.

GOLD DATA

+

POLICY KNOWLEDGE

=

ONE CONVERSATIONAL LAYER

A customer service example built with Lakehouse, Eventhouse, and a Fabric data agent.

One data stack. Two answers.

Structured facts and document rules meet in the same agent.

Build the AI layer in four moves

01

START AT GOLD

Use trusted Lakehouse tables as the source of business facts.

02

PREPARE KNOWLEDGE

Upload policy PDFs, extract text, split by section, retain source metadata.

03

EMBED + RETRIEVE

Generate local embeddings; store and search policy passages in Eventhouse.

04

CONNECT THE AGENT

Add gold tables and the KQL search function; test each route and combined questions.

Use what Fabric already gives you.

Keep custom code for the parts that are actually unique to your business.

- **LAKEHOUSE**
Business-ready tables + document landing

- **EVENTHOUSE**
Vector storage + similarity search

- **DATA AGENT**
Natural-language SQL and KQL

- **MCP**
An optional access path for other clients

Engineer the data once.

Make it usable through an AI layer.
